                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                           Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A_Geneseq_101002:*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypeptide comprises human neurotrophin-4/5 (NT-4/5) mature polypeptide. Methods are provided for large-scale purification of neurotrophins, including NT-4/5, suitable for clinical use. A claimed method comprises: (1) separating the neurotrophin from the other proteins using a hydrophobic interaction chromatography resin (HICR); and optionally (2) separating the neurotrophin from a chemical variant by high performance cation exchange chromatography (HPCEC). The processes can also be used for purification of e.g. human nerve growth factor (NGF) (see AAW48886), mouse NGF (see AAW48887), brain-derived neurotrophic factor (see AAW48888) and neurotrophins from various undesirable misprocessed, misfolded, size, glycosylated or charge forms. They allow selective separation from variants and other molecules, and from other polypers and from variants and other molecules, and from other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             isolation of neurotrophin(s) from, e.g. mis-folded or glycosylated
variant(s) - using hydrophobic interaction chromatography,
optionally in combination with high performance cation exchange
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beck
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptides with high pI. The processes are applicable to starting materials from various sources, including fermentation broths or lysed bacterial or mammalian cells.

This protein can be useful in treating damaged nerve cel or neurodegenerative diseases eg. Huntingdon's chorea, Alzhelmer's disease, ALS and Parkinson's disease.

NT-4 is a novel trophic factor with a broad tissue distribution. It complements NGF, BDNF, and NT-3, which are trophic factors for some peripheral neurons. This factor can act alone or with other trophic factors, on defined subsets of neurons to achieve the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Neurotrophic factor-4 - useful for treating neuro:degenerative diseases e.g. Alzheimer's and Parkinson's diseases, nerve cells damaged by e.g. diabetes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence shows a portion of the amino acid sequence of human neurotrophic factor-4 (NT-4), (full sequence ARR22465). Positions 70, 71 and 83 are positions of various amino acid substitutions. Substitutions at these positions can cause a marked differentiation in the activity of the trophic element.

The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge, or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal analogues of NGF, NT-3 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neurotrophic factor-4 - useful for treating neuro:de diseases e.g. Alzhelmer's and Parkinson's diseases, damaged by e.g. diabetes

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystines in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological activities of the CKGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;

                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAR47095-104 represent neurotrophin-4 (NT-4), CC fragments and derivatives of NT-4, and were derived from viper, CC Xenopus, rat and human. NT-4 is a member of the brain-derived neurotrophin factor (BNF)/nerve growth factor (NGF)/NT-3 gene family.

CC NT-4 proteins can promote the survival, growth and differentiation of neurons, such as basal forebrain cholinergic neurons. NT-4 proteins can be used to treat dopaminergic or cholinergic neuron of diseases and disorders. NT-4 related proteins may be used to treat peripheral neuropathy and diseases of the hippocampus and striatum. Disorders which may be treated in this way, include acute neuropraxia, neurotmesis, atoxmesis, diabetic neuropathy, amyotrophic lateral sclerosis or compression, a tumour, abscess, trauma, Alzheimer's disease, parkinson's disease or a disorder of the retina, especially convolving retinal gangilon cell degeneration. Anti-NT-4 antibodies may be used for diagnostic or therapeutic purposes, eg. to monitor the progression of diseases associated with alterations in the pattern of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence shows an NT-4 varient protein, in which the Arg residue at position 133 of NT-4 (sequence given in AR22465), is replaced by a His residue. This corresponds to position 53 of the mature NT-4 protein. This substitution renders the NT-4 resistent to proteolysis, thereby creating a varient of NT-4 that is more stable. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal analogues of BDNF, NGF and NT-4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence shows an NT-4 varient protein, in which the Phe residue at position 188 of NT-4 (sequence given in ARR2245), is replaced by a His residue. This corresponds to position 108 of the mature NT-4 protein. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Either Ser or Thr may be included at this point. This substitution changes an acidic amino acid for a hydrophillicly neutral one. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge, or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal analogues of NGF, NT-3 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence shows a portion of the amino acid sequence of human neurotrophic factor-4 (NT-4), (full sequence AAR22465). Position is a point of a non-conservative substitution which can cause a marked differentiation in the activity of the trophic element.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-SEP-1990;

Position 84 is a point at which substitution mutation causes a marked differentiation in the activity of the trophic element. Either Gln, His, Asn, Thr, Tyr or Trp may be included at this point. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NCF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge, or hydrophobicity, but where there is also a high degree of homology at the selelcted site within various animal analogues of NGF, NT-3 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Neurotrophic factor-4 - useful for treating neuro:degenerative diseases e.g. Alzheimer's and Parkinson's diseases, nerve cells damaged by e.g. diabetes

Position 116 is a point at which substitution mutation causes a marked differentiation in the activity of the trophic element. Either Glu, Asn, Gln, Tyr, Ser or Thr may be included at this point. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge, or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal analogues of NGF, NT-3 and

Position 85 is a point at which substitution mutation causes a marked differentiation in the activity of the trophic element. Either Glu, phe, Pro, Tyr or Trp may be included at this point. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge, or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal analogues of NGF, NT-3 and BDNF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neurotrophic factor-4 - useful for treating neuro:d diseases e.g. Alzheimer's and Parkinson's diseases, damaged by e.g. diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;

                                                                                                                                                                                                                                                                                                              The sequence shows a portion of the amino acid sequence of human neurotrophic factor-4 (NT-4), (full sequence AAR22465). Position 78 is a point at which substitution mutation causes a marked differentiation in the activity of the trophic element. Either Lys, His, Gln, or Arg may be included at this point. The sites of greatest interest for substitutional mutagenesis include sites where the amino acids found in BDNF, NGF, NT-3, and NT-4 are substantially different in terms of side chain bulk, charge, or hydrophobicity, but where there is also a high degree of homology at the selected site within various animal analogues of NGF, NT-3 and BDNF.
